### Step 1: Run the Executable Installer

1. Once the installer is downloaded, run the Python installer.
2. Check the **Install launcher for all users** check box. Further, you may check the **Add Python 3.7 to path** check box to include the interpreter in the execution path.

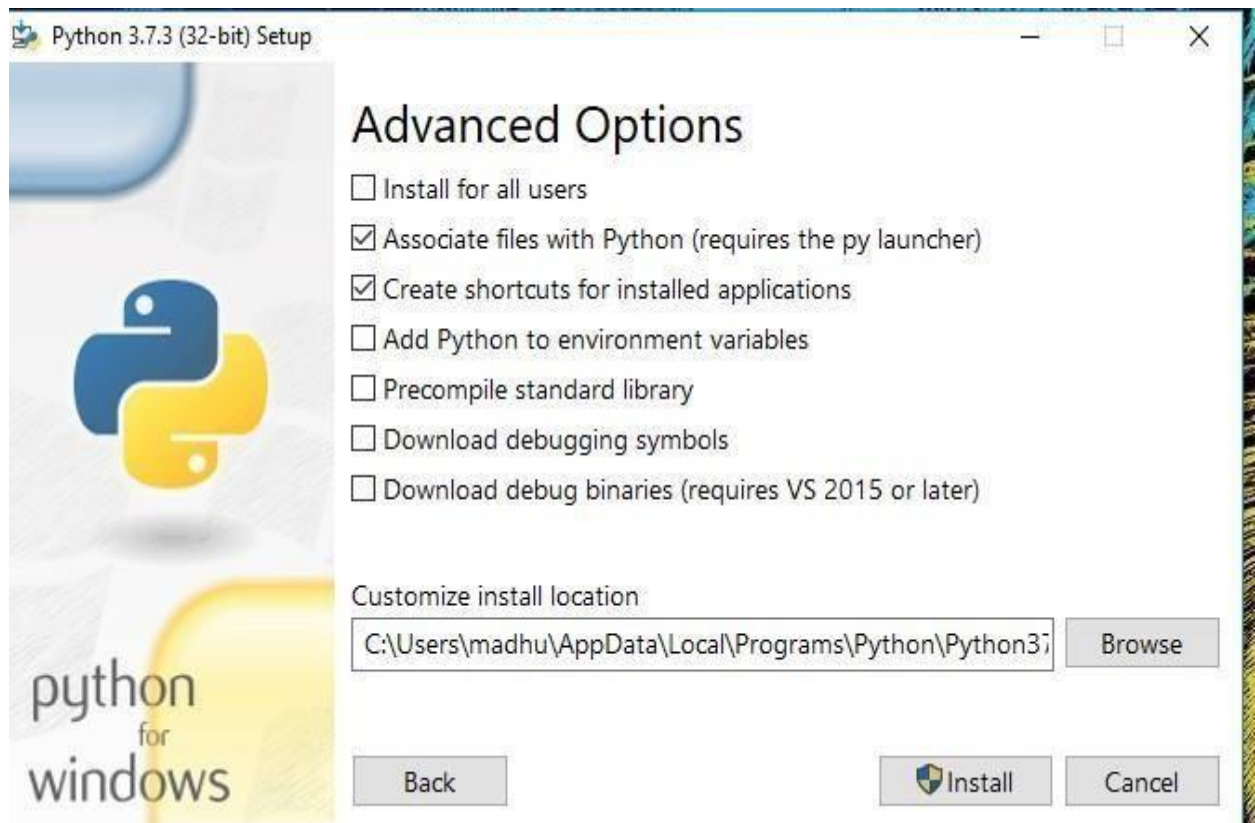

4. Select **Customize installation**. Choose the optional features by checking the following check boxes:
3. Documentation
4. pip
5. tcl/tk and IDLE (to install tkinter and IDLE)
6. Python test suite (to install the standard library test suite of Python)
7. Install the global launcher for `.py` files. This makes it easier to start Python
8. Install for all users.

Click **Next**.

9. This takes you to **Advanced Options** available while installing Python. Here, select the **Install for all users** and **Add Python to environment variables** check boxes. Optionally, you can select the **Associate files with Python**, **Create shortcuts for installed applications** and other advanced options. Make note of the python installation directory displayed in this step. You would need it for the next step. After selecting the Advanced options, click **Install** to start installation.

10. Once the installation is over, you will see a **Python Setup Successful** window.

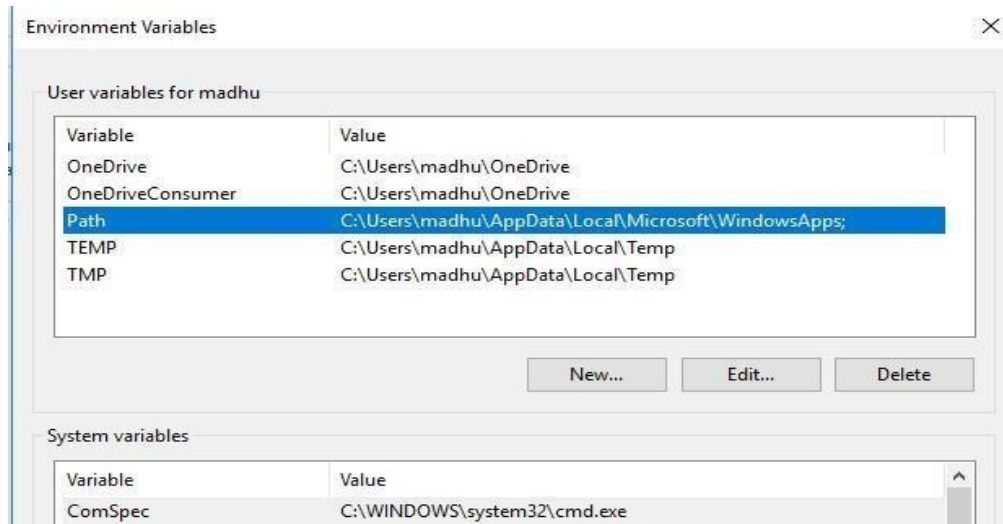

## Step 2: Add Python to environmental variables

The last (optional) step in the installation process is to add Python Path to the System Environment variables. This step is done to access Python through the command line. In case you have added Python to environment variables while setting the Advanced options during the installation procedure, you can avoid this step. Else, this step is done manually as follows. In the Start menu, search for "advanced system settings". Select "View advanced system settings". In the "System Properties" window, click on the "Advanced" tab and then click on the "Environment Variables" button. Locate the Python installation directory on your system. If you followed the steps exactly as above, python will be installed in below locations:

- C:\Program Files (x86)\Python37-32: for 32-bit installation
- C:\Program Files\Python37-32: for 64-bit installation The folder name may be different from "Python37-32" if you installed a different version. Look for a folder whose name starts with Python. Append the following entries to PATH variable as shown below:

## Step 3: Verify the Python Installation

You have now successfully installed Python 3.7.3 on Windows 10. You can verify if the Python installation is successful either through the command line or through the IDLE app that gets installed along with the installation. Search for the command prompt and type "python". You can see that Python 3.7.3 is successfully installed.

 Command Prompt - python

```
Microsoft Windows [Version 10.0.17134.765]
(c) 2018 Microsoft Corporation. All rights reserved.

C:\Users\madhu>python
Python 3.7.3 (v3.7.3:ef4ec6ed12, Mar 25 2019, 22:22:05) [MSC v.1916 64 bit (AMD64)] on
Type "help", "copyright", "credits" or "license" for more information.
>>>
```

An alternate way to reach python is to search for "Python" in the start menu and clicking on IDLE (Python 3.7 64-bit). You can start coding in Python using the Integrated Development Environment(IDLE).

A screenshot of a Windows application window titled "Python 3.7.3 Shell". The window has a standard Windows interface with a title bar, a menu bar (File, Edit, Shell, Debug, Options, Window, Help), and a main text area. The text area contains the following text: "Python 3.7.3 (v3.7.3:ef4ec6ed12, Mar 25 2019, 22:22:05) [MSC v.1916 64 bit (AMD64)] on win32", "Type 'help', 'copyright', 'credits' or 'license()' for more information.", and a prompt ">>> " followed by a vertical cursor bar. The window is set against a light blue background.

```
Python 3.7.3 (v3.7.3:ef4ec6ed12, Mar 25 2019, 22:22:05) [MSC v.1916 64 bit (AMD64)] on win32
Type "help", "copyright", "credits" or "license()" for more information.
>>> |
```

Hurray! You are ready to start developing Python applications in your Windows 10 system.
